Abstract

Local economic growth through innovation is often faced with a number of challenges that can hinder its adoption and development. These include infrastructure, access to technology, human resources, financial and policy support, and cultural barriers to change. The research method used in this study is the literature research method. The results show that limited access to resources, technology and specialized skills are the main factors limiting the adoption of innovations at the local level. Inadequate infrastructure such as weak internet connectivity, inefficient transportation networks, and unstable electricity supply were found to be major barriers. In addition, inadequate financial support and government policies that are less supportive of the innovation climate create additional constraints for local businesses. On the human resources aspect, there is a gap in the skills required for innovation, signaling a clear need for capacity building through education and training. While from a cultural aspect, resistance to change was identified as a significant barrier, requiring a more encompassing approach to engage local communities in the innovation process.

Keywords: Innovation, Creativity, Local Economy, Sustainability.

Introduction

The world today is in the midst of an era of globalization and rapid technological progress, in which each region strives to develop its local economy to compete and survive on a global scale. Innovation and creativity have become two key elements that not only drive economic growth, but also ensure its sustainability.

¹ Correspondence author.

Innovation, which involves the introduction of new products, more efficient production processes, as well as disruptive business models, is often the key to increasing the productivity and competitiveness of an economy. Creativity, as a source of new ideas and innovative solutions, provides the foundation for innovation. (Agustina et al. 2020). This synergistic relationship between creativity and innovation creates significant added value, accelerating economic growth through the creation of new jobs, the opening up of new markets, and improving the well-being of people. Thus, innovation and creativity not only support sustainable economic growth, but also strengthen economic resilience to various global changes and challenges (Aidara et al. 2021); (Ali, Anufriev, and Amfo 2021).

Moreover, innovation and creativity play a vital role in the transition to a more sustainable and inclusive economy. Amid global challenges such as climate change, social inequality, and the need for clean energy, innovation answers through the development of green technologies, a circular economy, and inclusive solutions that prioritize wider access and a fairer distribution of wealth. (Appolloni et al. 2022). Creativity in design and approach is key in identifying local needs and formulating innovative solutions that are not only effective but also efficient (Arici and Uysal 2022). Therefore, innovation and creativity are key factors in achieving economic development that is not only characterized by growth, but also by sustainability and inclusiveness.

However, challenges arise when efforts to implement innovation and creativity at the local level frequently face various obstacles, ranging from limited resources often becoming major obstacles; for example, a lack of capital for investment in research and development, or a shortage of workforce with the skills needed to drive innovation. (Arocena and Sutz 2021). Inadequate infrastructure can also hinder innovation processes, especially in remote areas. Besides, innovation often requires changes at the level of policy and regulation, but prolonged bureaucratic processes and resistance to change can hinder development. Other challenges include difficulties in accessing new markets, a lack of collaboration between local, academic institutions, and governments, and a minimum level of knowledge and awareness of the importance of innovation among local entrepreneurs. (Arslan et al. 2021). All of this requires a holistic approach and a coordinated strategy to overcome barriers to the implementation of innovation in the local economy. Therefore, it is important to understand how innovation and creativity can be effectively applied to growing a local economy that is not only flourishing but also sustainable. (Audretsch and Belitski 2021).

In the face of this era of the digital economy, local economies in many regions are under pressure from increasing competition. Meanwhile, the world is also facing an environmental crisis that drives the importance of sustainable practices. Thus, the local economy needs to be empowered not only in terms of its competitiveness, but also in its sustainability. (Avelino et al. 2022). Innovation and creativity, in this context, function double: as a driver of growth and as a solution for integrating sustainability principles into economic activities. (Awan and Sroufe 2022).

The role of innovation in the context of the local economy includes the application of new technologies, innovative business models, as well as the development of unique products or services. Meanwhile, creativity plays a role in identifying new opportunities, effectively solving problems, and adapting to change. (Boar, Bastida, and Marimon 2020). However, to realize the full potential of innovation and creativity, a supportive ecosystem is needed, which includes adequate infrastructure, availability of investment capital, competent human resources, and a conducive regulatory framework. (Bocken 2020).

Therefore, research into how innovation and creativity can be used as key tools in growing and supporting a sustainable local economy becomes highly relevant. Through this research, it is expected to find effective strategies in applying innovation and creativity at the local level as well as identifying solutions to the challenges faced. Thus, the study aims to provide insight into how local economies can thrive and adapt in the midst of global change while lining high sustainability values.

Research Method

The review conducted in this study used the literature research method. The literature research method, also known as literature review, is a systematic process of searching, evaluating, and synthesizing published research results to answer specific research questions or address specific topics. This research does not involve primary data collection but relies on secondary sources (Abdul et al. 2024); (Alfaisal, Hashim, and Azizan 2024).

Results and Discussion

The concept of innovation and creativity in the local economy

A local economy refers to all economic activities that take place within a limited geographical area, usually at the level of a city, district, or particular area. In the local economy, small and medium-sized play an important role and are often the backbone of the economy. (Carayannis 2020). A characteristic feature of the local economy is the proximity of interaction between producers and consumers, which allows for a responsive exchange of goods and services in accordance with the needs of local communities. This activity covers various sectors such as agriculture, manufacturing, services, and trade, which collectively contribute to the economic well-being of the region. (Castro-Arce and Vanclay 2020).

The scope of the local economy includes regional economic development, job creation, and improvement in the quality of life of the population of the area. Approaches in the local economy often prioritize sustainability, finding a balance between economic growth and environmental conservation. Initiatives such as sustainable industrial development, empowering small and medium-sized enterprises (SMEs), as well as improving local infrastructure are some examples of policies commonly implemented. (Cheng et al. 2021). Local economies also involve collaboration among various stakeholders, including local governments, the private sector,

educational institutions, and communities, to create ecosystems that are conducive to growth and innovation. (Chollisni et al. 2022).

Local economic innovation can be categorized into several types, including product innovation, process innovation, organization, and marketing. Product innovation relates to the development or improvement of goods and services offered in the local market. This can include the use of local raw materials, the use and use of new technologies, or the adaptation of products to the taste and needs of the local community (Ciasullo et al. 2020). Process innovation involves the improvement or application of new production methods that are more efficient, environmentally friendly, or that use digital technology to increase the productivity of local. Organizational innovation involves changes in management practices, organizational structure, or inter-business collaboration to improve performance and competition in the market. (Coenen and Morgan 2020). Meanwhile, marketing innovation refers to an attempt to market products in creative and different ways, for example through a unique branding strategy or a digital campaign that reaches a wider audience. (Compagnucci et al. 2021).

Local economic innovation models are usually implemented according to the conditions and needs of local communities. One comprehensive model is the development of economic clusters, where operate geographically interconnected and sectors are regulated to maximize collaboration, innovation, and efficiency (Costa and Matias 2020). Another example is a creative economy that emphasizes value creation through sectors such as art, media, design, and entertainment. Circular economy models are also beginning to be implemented to respond to sustainability needs, where resource reuse, recycling, and rejuvenation are sought to reduce waste and increase efficiency. These models focus on increasing local capacity and stimulating innovation to bring inclusive and sustainable economic growth (Dagilienė, Varaniūtė, and Bruneckienė 2021).

The process of creativity and innovation in the local economy begins with the identification of the needs and opportunities that exist in the community. It involves gathering insights from a wide range of local stakeholders, including entrepreneurs, consumers, government interests, and educational institutions, to understand the specific challenges facing the region's economies. (Dana et al. 2021). The process also includes mapping local resources, be they human, natural, or cultural, that can be used to create added value. Provided with a deep understanding of the local context, innovators can generate unique and relevant ideas and solutions. Creativity here serves as a major driver, enabling the development of new approaches or adaptation of existing models to meet the specific needs of the region. This creative thinking often involves cross-sectoral multidisciplinary collaboration, leveraging diverse expertise and perspectives to formulate innovative strategies. (Dias et al. 2023).

Furthermore, local economic innovation is realized through the implementation of such creative ideas into real practice. This process involves the development of new products, services, or business models that are tested and adapted to ensure their

effectiveness in meeting the needs of the local market. This implementation phase often requires experimentation and iteration, where feedback from consumers and local stakeholders is the key to further improvement. (Diepenmaat, Kemp, and Velter 2020). Financing, both from government and private sources, also plays a vital role in providing the capital support necessary for the realization of such innovations. In many cases, entrepreneurship education and training are an essential part of this process, strengthening local capacity for sustainable innovation. Thus, the process of local economic creativity and innovation not only produces new solutions but also strengthens the overall local economic ecosystem, promoting inclusive growth and development (Ding et al. 2021).

Innovation, Creativity and Local Economy

Innovation and creativity play a crucial role in driving local economic growth and sustainability. Through the implementation of creative and innovative ideas, local economies can cope with challenges such as resource constraints, market competition, and changing consumer needs. Creativity opens up opportunities to create added value to existing products or services or to develop new ones that are better suited to the needs and desires of the local market. (Distanont 2020). It not only improves the competitiveness of local but also stimulates the formation of new economic activities, which play a role in creating jobs and strengthening the regional economic base. Technological innovations, for example, can maximize production and operational efficiency, while innovations in marketing and distribution can expand market reach so as to stimulate local economic growth. (Domanski, Howaldt, and Kaletka 2020).

Besides, innovation and creativity also help local economies adapt to rapid and unexpected changes in a global scenario. For example, in the face of an economic crisis or a pandemic, creative ideas can be used to modify a business model or implement a more robust new business strategy. (Duxbury et al. 2020). These include providing products and services through digital platforms or adopting environmentally friendly business practices that meet global sustainability standards and enhance local brand recognition. Creativity and innovation often open the door to collaboration between, academic institutions, and governments, creating synergies that support the development of sustainable innovation. (Edwards 2021). Thus, the role of innovation and creativity is not only vital in increasing the relevance of local markets in a dynamic economy but also important in building long-term economic resilience that can face a variety of external challenges that may arise.

Innovation is a major motor of local economic growth, driving the wheel of development through increased efficiency, the creation of new products, and the opening up of fresh markets that local can explore. (Elmo et al. 2020). By applying new technologies, better production methods, or innovative business models, innovation can boost the productivity and competitiveness of small and medium-sized enterprises (SMEs) as well as local industries, giving them an edge in facing severe market competition at both regional and global levels. (Endl et al. 2021). Innovation also drives

economic diversification, avoids dependence on a single source of income and creates wider employment opportunities, contributing to regional income and improving the quality of life of local people. Therefore, investments in research and development, as well as education and infrastructure that support innovative ecosystems, are critical for sustained economic growth at the local level. (Fernandes et al. 2021).

Creativity plays an important role in solving local problems, offering new and effective alternatives to overcoming obstacles as well as unique challenges within a particular community. By encouraging different thinking and considering different perspectives, creativity can be a catalyst for solutions that not only sustain and value the cultural and environmental context of the region, but also encourage community participation and local ownership of the process of change. (Gasparin et al. 2021). Applying creative methods in solving specifically localized problems can lead to positive and sustainable transformations, such as strengthening the local economy, improving public services, and improving community well-being. In this scenario, individuals oriented towards creativity and innovation are valuable assets, adapting knowledge and technology to find solutions that are appropriate and adapted to local realities. (Gherghina et al. 2020).

Sustainable Local Economy

The concept of sustainable local economy focuses on economic development that prioritizes a balance between economic growth, social justice, and environmental protection within the local scope. This approach involves the efficient use of local resources, the development of local enterprises that respond to the needs and situations of local communities, as well as efforts to preserve the survival of natural resources for future generations. (Haddad et al. 2020). Sustainable local economies emphasize responsible production and consumption, supported by environmentally friendly innovations and technologies, as well as strengthening economic connections within communities by creating jobs and providing sustainable goods and services. Thus, it not only helps in creating greater economic resilience to external shocks, but also builds social justice and preserves the environment, making sustainable local economies an important pillar of inclusive and equitable long-term development. (Halim et al. 2021).

The criteria for a sustainable local economy cover some key aspects, the first being economic independence. This means that the local economy must be able to meet its own needs through the production and distribution of goods and services within the community without excessive dependence on the outside. (Hao and Fu 2023). The second aspect is social justice, which emphasizes the equitable distribution of income and employment opportunities for all members of society. It also includes equal access to resources and participation in economic decision-making processes (Hermundsdottir and Aspelund 2021). The third aspect is sustainable environmental management, that is, the use of natural resources in a way that does not harm the ecosystem and ensures that such resources remain available for future generations. Independence, social

justice, and environmental sustainability are the foundations that keep local economies sustainable in the long term (Hernita et al. 2021).

Sustainable local economic indicators include, among other things, the degree of local economic dependence on imported resources, which should be minimal, and the level of use of local products in economic activities. Another indicator is the distribution of income within the community, where the gap between the highest and the lowest income is awakened at a reasonable level, as well as low unemployment rates. (Huang et al. 2022). Sustainable environmental indicators include the level of local biodiversity, efficiency in resource use, and the minimum level of environmental pollution or degradation resulting from economic activity. The health of local economies can also be judged by the economic resilience to crises, local innovation, and capacity to adapt to global and environmental change. These indicators help in measuring not only the economic performance but also the social and environmental resilience of a local economy. (Iqbal et al. 2020).

Sustainable local economy best practices often involve initiatives that integrate principles of independence, environmental sustainability, and social justice. Examples include a local seed bank programme that supports sustainable agriculture by preserving the diversity of local crop varieties, a system of exchange of goods and services that promotes a fair economy and reduces dependence on traditional currencies, and small and medium-sized enterprises (SMEs) that prioritize the use of local resources and local labour, while implementing environmentally friendly and fair practices in their management. (Jonek-Kowalska and Wolniak 2021). Other approaches include eco-ecosystems initiatives that exploit local environmental and cultural potential without compromising its sustainability, and community education programmes on the importance of sustainable consumption and a circular economy. The success of these practices often depends on active community participation, cross-sectoral cooperation, and policy support that drives innovation and local-international partnerships. Thus, sustainable local economic practices not only improve economic well-being but also build social cohesion and environmental sustainability for present and future generations. (Joshi and Dhar 2020).

Challenges in Growing Local Economies through Innovation

Growing the local economy through innovation is not a simple process. Some key challenges often arise, such as restrictions on access to resources and technology. Local communities, especially in remote or underdeveloped areas, often find it difficult to access the latest technologies that can accelerate growth and innovation. (Korsgaard et al. 2020). Infrastructure constraints such as poor internet connectivity, inadequate transportation networks, and limited electricity availability can hinder innovation progress and its implementation at the local level. (Lange 2023).

Another challenge is the lack of financial and policy support from the government. Although many local governments have a desire to drive innovation, they often do not have supportive policies or sufficient funds to finance innovative projects.

Without adequate fiscal incentives, subsidies, or regulatory support, small and local start-ups may not be able to compete with large companies or develop their innovative products well. (Lazarevic, Kautto, and Antikainen 2020).

Human resource capabilities and skills are also important challenges. Economic development through innovation requires skilled workforce in areas such as information technology, management, and marketing that are often not available in local communities. These shortcomings can slow innovative initiatives or make outcomes less optimal. Education and training are key to addressing this problem, but it requires investment and time that may not be available immediately in the local economy. (Leckel, Veilleux, and Dana 2020).

Finally, resistance to cultural change and adaptation can be a barrier to the introduction of innovation in local communities. Innovation often requires a change in the traditional way of working or in a long-standing business model. (Lee 2020). It can provoke scepticism or reluctance from local communities who might be more comfortable with their old ways. To overcome this, it is important for innovators to involve communities in the development process, show clear benefits of change, and build confidence through transparency and effective communication. (Lita, Faisal, and ... 2020).

In conclusion, growing the local economy through innovation requires not only creative ideas and new endeavours, but also comprehensive solutions to address the challenges facing. These challenges range from restricted access to resources and technology, lack of financial support and government policy, constraints in human resource skills, to cultural resistance to change. Effective solutions would involve improving infrastructure, providing policies that support innovative initiatives, investing in education and training, and communications efforts that encourage participation and support at the community level. A holistic and collaborative approach by all stakeholders is essential to ensuring that local economies can thrive through sustainable and inclusive innovation.

Conclusion

The challenge of growing local economies through innovation reveals that one of the main obstacles is limited access to resources and technology. Unsupporting infrastructures such as weak internet connections, poor transportation, and unstable power supply hinder innovation from reaching its potential in local communities. Besides, the lack of financial and policy support from government entities often makes it difficult for entrepreneurs to develop their innovative ideas that require capital support and favourable regulation.

On the human resource side, the skills needed to drive innovation are often not available at the local level, raising the need for investment in education and training to enhance the capacity of the labour force. Locals may not have adequate skills in information technology, management, or marketing, which are key elements for

success in an innovation-based economy. Without skilled workforce, local will have difficulty developing, implementing, and marketing innovations effectively.

Resistance to change is a significant cultural barrier, where innovation often requires transformation in long-rooted working practices and business models. Failure to engage the local community and show the real benefits of innovation can result in failure to accept and integrate new ideas. Therefore, an approach that involves clear, transparent communication, and trust-building with the community is essential to successfully implement innovation in the local economy.

From a theoretical point of view, the challenge of building local economies through innovation provides important insights into the dynamics of sustainable economic development. Traditional economic theories that emphasize scalability and efficiency through globalization may not be fully applicable to local contexts, where resources and capacity are more limited factors. This calls for the development of a new theoretical framework that focuses more on local resilience, adaptability, and inclusion. Innovation in this context is measured not only by economic growth, but also by improving the quality of life, reducing inequalities, and preserving resource sustainability. Through this perspective, economic theory can further encourage a holistic approach to developing local economies, instilling the importance of cooperation, and appreciating diversity in problem-solving.

In practice, understanding these challenges leads to formulating more effective strategies in supporting innovation at the local level. For companies, this means strategically adapting technological innovation to meet the specific needs of the local community, building partnerships with local stakeholders, and investing in the development of SDM through training and education. For governments, there is a need to create policies that support local innovation ecosystems, such as providing incentives for small and medium-sized enterprises, facilitating access to capital, and building supportive infrastructure. These implications highlight the importance of an integrated and collaborative approach between governments, the private sector, and communities in shaping a dynamic, resilient, and inclusive local economy, in which innovation acts as a catalyst for growth and development.
